

MOBILE EQUIPEMENT

MOBILE RINGS

WITHDRAWABLE MOBILE RING

For countries or regions prone to hurricanes, PETITJEAN has developed a **withdrawable mobile ring range**:

The ring is lowered to the ground level and then the part supporting the floodlights can be withdrawn and fixed to the bottom mast, while the other part is raised to the top. Floodlights are secured on the ground level and no cable stays outside along the mast.

GUIDED MOBILE RING

Each mobile structure is designed and manufactured according to its lighting equipment, allowing a **totale adaptation to customer's requirements**.

An aluminium star-shaped ring is fixed on a galvanized steel mobile head.

The mechanism slides up and down on a anodised aluminium guiding rail on a mobile cart *(see on next page the full description of this system)*.

This system allows to lower floodlights to the ground level even in strong wind conditions.
